

## Read Me

The read me is simple. The practitioner only has to correct relative paths, which are still set to my directories, they are typically set at the top of the script. From script to script the naming might need changing. Searching for the locations is very helpful in that regard to replace the text blocks from site to site.

### Alignment

I added the entire alignment process in terms of files as a folder since correcting each frame individually has proven itself to be quite tedious and needs lots of work and time. Therefore, I added this folder which can still be run and adjusted if needed within the corresponding alignment script.

### Data

The data folder contains the formatted and reduced .txt files of each frame per study site. These are already pre-processed in terms of exporting them manually via IRBIS 3, deleting the 100<sup>th</sup> file, and reducing the amount to 24 h, as well as assigning them a time and date.

The defined AOI rockwall masks are also included in the data folder. They need to be copy pasted into each results folder or with slight adjustments to the script sourced individually.

Within the folder there are also the TLS pointclouds from the Paradiestal and Lehesten. They were directly exported from RiscanPro.

Finally, the full weather data of the EBG station is included.

### Scripts

The scripts need adjusting in terms of reference/relative pathways. Their order is indicated by the number at the back of their name and need to be run in that order. Scripts 1 and 2 do not need to be run, since these steps were already done for the practitioner in that sense. Scripts 3-5 are alternating scripts of the alignment since normally the alignment was done to then be checked with images and the GIF. If the practitioner only wants to run my data only script 4 is necessary. The remaining scripts are then self-explanatory, however it is necessary to paste the AOI from another folder into the results folder before running the script. This process is not optimal and can be improved for future work.
